

TRISTAN JAY L. AMIT

SOFTWARE DEVELOPER | ZAMBOANGA CITY, PHILIPPINES
+639169620013 | [My LinkedIn](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Software Developer (5+ years) specializing in the **PHP/Laravel** ecosystem. I have a track record of architectural ownership, from designing **scalable APIs** to optimizing **MySQL/Redis** performance for high-concurrency environments. Beyond core backend, I bring practical experience with **CI/CD and cloud reliability** to ensure seamless, stable deployments. I'm driven by solving messy architectural bottlenecks and building systems that don't just work, but scale

SKILLS SUMMARY

- Backend: PHP (Laravel), Javascript (Node.js), Python (Fast API).
 - Frontend: React.js, TypeScript, JavaScript (ES6+), HTML5/CSS3.
 - Databases & Caching: MySQL, PostgreSQL, Redis
 - DevOps & Cloud: Docker, GitHub Actions (CI/CD), Vercel, Hostinger (VPS).
 - AI Integration: OpenAI API, Claude API.
 - Specialties: RESTful API Design, Scalable System Architecture, Performance Optimization.
 - Soft Skills: : Technical Communication, Cross-functional Collaboration, Adaptability, Mentorship.
-

EXPERIENCE

Software Developer

Sep 2022 - Present

ZAMBOANGA CITY MEDICAL CENTER

- **Architected** and deployed a standardized on-premise production environment from scratch to support the transition to in-house software. By configuring the full stack—including load balancers, web hosting, Redis, and MySQL—and automating deployments via **GitHub Actions and Docker**, I eliminated the need for third-party hosting and management.
- Built a web-based **e-bidding** system that digitizes supplier participation and standardizes procurement workflows, incorporating performance-based scoring from historical transactions and documents while **automating bid computations** for consistent and transparent evaluation results.
- Participated in the development of a **company-wide public dashboard** that enables real-time monitoring of transactions, tracks fund allocation and utilization, and provides consolidated insights into emergency room and outpatient data, including top services availed, leading medicines, and overall medical inventory status.
- **Led the development** of a centralized User Management System to unify identity and access control across internal applications, implementing role-based access control (RBAC) and secure API key generation to support authenticated cross-system communication.
- **Standardized authentication** across core company systems including ERP, Inventory, Employee Clinic, and Monitoring platforms by designing a centralized Laravel-based API integration with **Single Sign-On (SSO)**, reducing reliance on fragmented legacy login systems and enabling secure cross-application access via UMIS.
- Designed and implemented a **telemedicine** and **Referral system** connecting remote clinics and secondary hospitals to a tertiary hospital, using a RESTful API backend and a WebRTC-based video conferencing solution with CoTURN for NAT traversal, improving patient triage and reducing emergency room congestion.

Back-End Developer

2021 - 2022

CECILE PHARMACY | FREELANCE

- Developed a centralized **PR/PO procurement system** using Node.js and React.js to digitize requisition and purchase order workflows, enabling **automated generation** of purchase requests based on inventory and sales data and producing standardized supplier-ready PO documents for pharmacy procurement.

Full Stack Developer

2020 - 2021

START UP | FREELANCE

- Developed **BeeLika**, a **multi-platform** e-commerce system (Flutter/Dart) with Store, Delivery, and Customer applications, supported by a Node.js backend to manage real-time inventory tracking, order processing, and basic stock replenishment workflows for retail and small store operations.

PROJECTS

Personal & Academic Projects

- Developed a **Social Distancing Monitoring** and Alert system enforcing 1-meter distancing during COVID-19 using Python and machine learning, with multithreading for parallel processing
- Developed a ride-hailing-style tricycle booking system as a thesis project using Flutter, Dart, Firebase, and **Google Cloud Platform geolocation services**, implementing real-time tracking and route visualization with **Polylines**, and introducing **standardized fare computation** to improve pricing consistency between riders and drivers.
- Built a real-time pH and **soil moisture monitoring system** using Flutter, Dart, Arduino, and Firebase, enabling remote monitoring of agricultural environmental data through sensor integration and mobile app visualization.

EDUCATION

Wester Mindandao state University (2017-2022)

- Bachelor of Science in Computer Science, 2022.
